

introduction

The twenty third century Phaser co-designed by Jefferies and Roddenberry was standard issue aboard Starfleet vessels. Although primarily intended as defensive weapons, their power, design and flexibility made them useful for heating rocks, cutting through armour plating and even as a backup energy source capable of powering a small shuttle craft into orbit in an emergency.

This Original Series Phaser Universal Remote Control is not a toy: it is an advanced, gesture based universal remote control, designed to control home entertainment

charging

Both Phaser I and II are powered by a rechargeable lithium power cell in the Phaser I. Before first use charge your Phaser I for two hours, or until the mode selector button flashes green. To charge, undock the Phaser I from the Phaser II by pressing the release button on the left hand side of the Phaser II and insert the micro USB cable supplied, and charge from any suitable powered USB socket. Note: the charging cable can be found under the stand in the Phaser's protective transit case.

The Phaser indicates that it needs charging

equipment such as TVs, DVD players, Blu-ray players and iPod docks, using infrared codes learned from conventional remote controls by the means of gestures rather than by pressing buttons. A total of nine different gestures and four separate memory banks enable the Phaser to learn up to 36 remote control functions.

At the press of the trigger button, the Phaser pulses and produces one of nine different Phaser firing sounds (depending on the setting of the Phaser II dial), and has the power to instantly stun almost any TV without any setup required.

by saying "power cell drained" after a gesture. The Phaser I may be used undocked while it is charging. The Phaser II does not need charging; it takes its power from the Phaser I.

basic functionality

The Phaser universal remote control consists of three major components: Phaser I, Phaser II and the grip. When assembled they create a highly accurate facsimile of the original Phaser.

The Phaser I houses the Phaser's three primary microcontrollers, its rechargeable lithium battery and its infrared emitter. As a result, the Phaser I can operate on its own when undocked from the Phaser II. When undocked, its various functions are activated by pressing the Phaser I trigger button located on its underside.

trigger button for use when Phaser I is not docked to Phaser II

When the Phaser I is docked, its various functions are activated by pressing the trigger button above the grip under the main body of the Phaser II.

docking and undocking the Phaser I

To dock the Phaser I, insert the front of the Phaser I into the Phaser II front docking recess, at a slight angle, and then push the back of the Phaser I into place until the locking catch clicks.

To undock the Phaser I, press the release button on the left hand side at the back of the Phaser II to release the locking catch. Lift the back of the Phaser I and gently pull it backwards out and away from the Phaser II dock.

Personnel must take care not to damage the connector pin array when undocking and docking the Phaser I. The contacts on the bottom of the Phaser I should never be shorted together.

attaching the grip

To attach the grip, push the asymmetrical locator pins into their matching slots in the base of the Phaser II. To secure the grip, gently tighten the grip-securing bolt with the special Enterprise screwdriver supplied. Do not over tighten.

Enterprise screwdriver

powering up and down

Press and hold the mode selector button (a long press) to power up or power down the Phaser.

operational modes

The Phaser has three main operational modes. Users can cycle through each mode with a single short press on the mode selector button: Practice Mode, short press ⇨ Control Mode, short press ⇨ FX Mode, short press ⇨ back to Practice Mode again, etc.

Practice Mode

Only correctly trained personnel are permitted to use the Phaser, so before entering any other operational mode, all personnel must learn how to do the movement gestures correctly.

To enter Practice Mode, press the mode selector button until the P is lit red.

In Practice Mode, each time a gesture is performed while the trigger button is pressed and held, the Phaser will say which gesture it thinks has been attempted. If the Phaser misinterprets a gesture, hold it steady for a few seconds then repeat the gesture taking care to use short, accurate, positive movements. Once the gestures have been mastered, the user is cleared to move on to Control Mode, where the use of live infrared (IR) beams will enable the control of domestic equipment with the Phaser.

Control Mode

To enter Control Mode, press the mode selector button until the C is lit and then double-click press the mode selector button to select the required memory bank. Each double-click press will cycle to the next memory bank and the C will glow either red, green, blue or yellow depending which memory bank is selected. Each memory bank

stores up to nine codes. Therefore the Phaser can store up to 36 codes in total.

To fire a remote control code, press and hold the trigger button and do one of the eight movement gestures. Each time a gesture is performed correctly (while the trigger button is pressed), the Phaser will fire the infrared (IR)

Practice Mode

Only correctly trained personnel are permitted to use the Phaser, so before entering any other operational mode, all personnel must learn how to do the movement gestures correctly.

To enter Practice Mode, press the mode selector button until the P is lit red.

In Practice Mode, each time a gesture is performed while the trigger button is pressed and held, the Phaser will say which gesture it thinks has been attempted. If the Phaser misinterprets a gesture, hold it steady for a few seconds then repeat the gesture taking care to use short, accurate, positive movements. Once the gestures have been mastered, the user is cleared to move on to Control Mode, where the use of live infrared (IR) beams will enable the control of domestic equipment with the Phaser.

Control Mode

To enter Control Mode, press the mode selector button until the C is lit and then double-click press the mode selector button to select the required memory bank. Each double-click press will cycle to the next memory bank and the C will glow either red, green, blue or yellow depending which memory bank is selected. Each memory bank

stores up to nine codes. Therefore the Phaser can store up to 36 codes in total.

To fire a remote control code, press and hold the trigger button and do one of the eight movement gestures. Each time a gesture is performed correctly (while the trigger button is pressed), the Phaser will fire the infrared (IR)

FX Mode

In FX Mode, after 30 seconds of inactivity the Phaser hibernates and does not consume any power unless the trigger button is pressed. It does not have to be powered down, and so remains ready for use at a moment's notice. If the Phaser I is docked, then pressing the trigger button fires the Phaser with the firing sound as set on the dial. If the Phaser I is not docked, then the firing sound is that of the last dial setting before the Phaser I was undocked.

In FX Mode, setting nine on the dial selects the Phaser Overload sound effect. A short press of the trigger button starts the Overload sequence and a second short press stops it.

In FX Mode, setting zero on the dial selects Starship sounds. Pressing and holding the trigger button and then doing a movement gesture plays one of eight authentic sounds from the USS Enterprise.

lock function

The Phaser can be locked to prevent its use by unauthorised personnel. To lock the Phaser, press the mode selector button four times quickly and enter any four-digit Lock Code at the spoken prompt.

Where no IR code has been programmed onto the gesture, the Phaser will not fire but will say "unassigned". Phaser II dial settings from one to nine will select different Phaser firing sounds. If the Phaser II dial is set to zero, then each time the trigger button is pressed and a gesture is performed correctly, the Phaser will emit the IR code programmed onto that gesture, make a quiet click and the emitter will flash, but no firing sound will be heard. If no IR code has been programmed onto the gesture, the Phaser emitter will flash but it will remain silent.

When the Phaser I is undocked, the code may be entered by rapidly pressing the mode selector button to count out each digit of the code, pressing the trigger button after each digit to confirm.

If the Lock Code is forgotten, it may be overridden and erased by entering the master unlock key: 2254.

The Lock Code can be erased and locking disabled, by pressing the mode select button quickly five times whilst the Phaser is unlocked.

programming the Phaser

Before properly trained personnel will be able to use the Phaser to control equipment in their quarters, it will need to be programmed with the infrared (IR) remote control button codes of those devices requiring control. The Phaser has nine different gestures or actions. It has four separate memory banks (red, green, blue and yellow) and can store one remote control code per gesture/action in each memory bank, therefore allowing up to 36 remote control codes to be stored in total.

The Phaser should only be programmed when it is undocked. To enter Programming Mode press the mode selector button with two short button presses quickly followed by a long press (holding the button down for three seconds). The Phaser will say, "entering programming mode".

To program the Phaser, press and hold the trigger button then perform the desired gesture; the Phaser will say which gesture has been done, then the mode selector button will blink rapidly to signify that it is waiting to receive the IR code (button press) from a normal remote control.

Hold a normal remote control about 1" (2.5cm) from the beam emitter of the Phaser I while it is glowing, and briefly press and release the normal remote control button for the function you want to program on to that gesture. If the Phaser received the IR code successfully, it will say "OK". If it receives no IR signal after five seconds, it will stop waiting for the IR code, the emitter will stop glowing and another gesture will have to be performed to make the Phaser ready to receive an IR code again.

Further codes may be programmed onto any other gesture or reprogrammed over the existing code on the same gesture by repeating this process, without having to exit Programming Mode each time a code has been learned.

Two quick presses of the mode selector button in Programming Mode will cycle between its four memory banks (red, green, blue and yellow) allowing storage of up to four different sets of nine IR remote control codes.

Programming Mode can be exited at any time with one short press of the mode selector button. It will automatically exit Programming Mode if no gestures are performed after one minute.

Programmed IR codes are preserved even if the battery becomes completely discharged. However, while in Programming Mode, ten short presses of the mode selector button erases all memory banks and performs a factory reset. Caution: this operation can not be undone.

If programming problems occur

- Try varying the duration of the original remote control button press from very brief up to about half a second.
- Try varying the distance from the beam emitter of the Phaser I to the original remote control from 0.5" to 2" (1cm to 5cm).
- Try replacing the batteries in the original remote control.

adjusting the volume

To adjust the Phaser sound volume, press mode selector button six times and turn the Phaser II dial to select the volume required. When the volume is set at the correct level, press the trigger to confirm the setting. After setting the volume, remember to reset the dial to the desired firing sound effect.

Care instructions

This Phaser is a sensitive instrument of control and should be handled with care. Clean only with a soft, slightly damp cloth; do not immerse in water; do not insert anything into the aspirator grille opening. To protect the Phaser while not on display, keep it safely in its shock-absorbent transit case.

button pressing guide

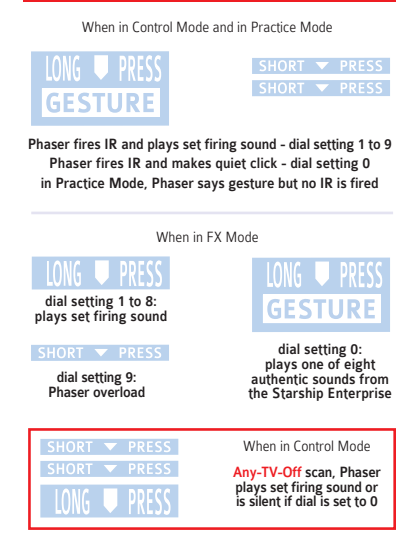

The Phaser has many exciting features and two buttons, which require a number of different button pressing sequences to access all these features. Depending on the mode the Phaser is in, certain button pressing sequences will do different things.

FX Mode has been designed especially for play and cosplay. After 30 seconds of inactivity the Phaser hibernates and does not consume any power unless the trigger button is pressed, and so does not need to be powered down and remains ready for use at a moment's notice.
